CORE SKILLS

Languages
Rust, Go, C++, Python, TypeScript, JavaScript

AI training & evaluation
Code-task design, model-response evaluation, preference ranking, rubric writing, reference solutions, test-based verification

Systems
Compilers and language tooling, interpreters, query engines (SQL, graph), WebAssembly, command-line tooling

Testing
Unit and integration tests, regression suites, fail-before/pass-after verification, flaky-test detection

Tooling
Git, Docker, Linux, CI pipelines, cargo, npm, pytest, Playwright

EDUCATION

Higher National Diploma, Statistics
Federal College of Animal Health & Production Technology (FCAH&PT)
2019 – 2024

Software Engineering: Full-stack Development & Cybersecurity
SQI College of ICT
2024 – Present

Cybersecurity Analyst Programme
Tilcareer London Institute
In progress

STRENGTHS

Precise technical writing

Reading large unfamiliar codebases

Rigorous, reproducible evaluation

Clear reviewer feedback

PROFILE

Software engineer with 4+ years of experience who works with AI labs to train and evaluate large language models on real software engineering. I write and review coding tasks, reference solutions and test suites, judge model-generated code for correctness and quality, and design hard, fair problems inside real open-source codebases. Comfortable across systems languages, compilers, query engines and web tooling, with a strong habit of verifying every claim with tests.

EXPERIENCE

Shipd
Oct 2025 – Present

Challenge Author, Olympus program (AI coding evaluation)

- Design advanced software engineering challenges inside real open-source repositories, used by AI labs to measure and improve autonomous coding agents.
- Implement each feature or fix end to end as a reference solution, often across parsers, planners, runtimes and public APIs in Rust, C++ and Go.
- Write hidden test suites that fail on the original code and pass only with a correct implementation, and package everything in reproducible Docker environments with JUnit reporting.
- Write concise, unambiguous problem statements so that every tested behaviour is specified and nothing untested is required.
- Calibrate difficulty against blind runs of AI agents, analyse why agents fail, and iterate on platform quality reviews covering fairness, test quality and solution quality.

AfterQuery
Oct 2024 – Sep 2025

AI Training Contributor, Software Engineering

- Create expert software engineering data for frontier AI labs: realistic coding tasks with clear requirements, reference solutions and verification tests.
- Evaluate model-generated code and explanations for correctness, efficiency, security and readability, and write detailed critiques and improved answers.
- Build grading rubrics and edge-case checks so model outputs can be scored consistently.

Outlier
Oct 2023 – Sep 2024

AI Training Contributor, Coding

- Wrote coding prompts and ideal responses used to fine-tune large language models.
- Ranked and rated competing model responses (RLHF), justifying preferences on correctness, completeness and clarity.
- Ran and debugged model-generated code to verify claims, flagging errors, hallucinated APIs and unsafe patterns.

OPEN-SOURCE CODEBASES WORKED IN

Programming languages & compilers: Rune, Otterlang, Dyon (Rust), Coi (C++ to WebAssembly), Bunster (Bash to Go)

Databases & query engines: Polyglot (SQL transpiler), Grafeo (graph database, Cypher), mq and jsongrep (query languages)
